REFERENCE

Miele Waterproof System Fault Guide

Quick Reference Card

Understand what triggers the Miele waterproof system fault and how to respond. Keep this guide handy to protect your laundry room from water damage.

How the Waterproof System Works

- Double-solenoid valve controls water intake at the tap.
- Double-walled inlet hose catches and redirects ruptures.
- Base pan float switch detects as little as half a cup of water.
- Automatically shuts off water valves and activates drain pump.

Common Fault Triggers

- Detergent overdosing causing excess suds to overflow.
- Torn rubber door boot seal from zippers or sharp objects.
- Loose internal hose connections.
- Blocked drain pump filter forcing water to back up.

Immediate Actions to Take

- Turn off the main water supply to the washing machine.
- Disconnect the machine from its power source safely.
- Check the drain pump filter for obvious blockages.
- Leave internal diagnostics to professional repair technicians.
